AB AP2 inhibiting biphenyls substituted in the 2-position by a substituted 5-membered heterocycle and in the 3'-position by a carboxyalkyl, carboxyalkenyl, carboxymethoxy, carboxymethylamino, or 5-tetrazolylmethyl group, were prepared. The compds. are useful for treating diabetes and related diseases, especially Type II diabetes (no data) and may be used in combination with another antidiabetic agent such as metformin, glyburide, troglitazone and/or insulin. Thus, 2-BrC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H was treated with benzoin and the resulting keto ester cyclized to give 2-(2-bromophenyl)-4,5-diphenyloxazole which was coupled with 3-OCHC<sub>6</sub>H<sub>4</sub>B(OH)<sub>2</sub> to give the biphenyl derivative I [R = CHO]. Reduction of the formyl group, chlorination,

and

reaction with NaCN gave I [R = CH<sub>2</sub>CN] which was cyclized with Me<sub>3</sub>SnN<sub>3</sub> to give I [R = 5-tetrazolylmethyl].

AB The electronic excitation and polarization spectra of  $\omega,\omega'$ -bis(4,5-diphenylimidazol-2-yl)-p-oligophenyls and higher substituted derivs. were measured. The spectra were interpreted with the aid of SCF configuration interaction-calculns. in the Pariser-Parr-Pople approximation. The most intense electronic transitions are related to the A, H, B and C bands of p-oligophenyls. The longest wave transition of all compds. is polarized parallel to the long mol. axis. The conformations of the mols. in solution are discussed. With an increasing degree of substitution the outer substituents are more twisted against the plane of the heterocyclic system. This effect will be realized as well in the spectroscopical data as in the quantum mech. calculns. The intense fluorescence emission of the mols. was investigated. In it discussed in terms of structure. The phosphorescence emission observed at  $-190^\circ$  is of  $\pi-\pi^*$ -type. It is polarized in the plane of the mol. as far as measurable.
